On the cover: The Four Classical Elements, Water, Earth, Wind (Air) and Fire provide the names for AudioQuest's newest series of analog-audio interconnects. The Elements Series showcases all that AudioQuest knew before, as embodied in predecessors Columbia, Colorado, Niagara and Sky, plus many surprisingly audible evolutionary refinements. Top Element Fire not only employs all the River-to-Element improvements, but also gets the same RCA and XLR plugs recently introduced on the Wild and WEL Series.

AudioQuest History

AudioQuest's founder and chief designer, William E. Low (Bill), likes to say he never wanted a job, and never had a plan. What Bill means is that he became interested in audio equipment as a teenager and then as a college student through his love of music. Eventually necessity led him into designing and managing signal-carrying cables. So, AudioQuest was never planned so much as it evolved ...

Like many of his generation, Bill was swept up in the unprecedented rate of change in the popular consciousness instigated by the music of the 1960s and early 1970s. This revolution changed the fundamental language of our culture forever, and being swept up in this cultural wave had a profound effect on Bill's direction in life.

Like Apple's Steve Jobs, Bill attended progressive Reed College in Portland, Oregon in the early 1970s where he shared his passion for music by selling audio systems to his classmates. By 1976, with his college days in the rearview mirror, Bill found moving to California and working in audio irresistible. After a one-year stint as a manufacturer's representative in the San Francisco Bay Area, Bill continued south, eventually opening a small, by-appointment, high-end audio salon in Santa Monica.

During this time, Bill recognized that deficiencies in signal-carrying cables were a source of a significant share of the distortion in an audio system (a realization Bill would also come to regarding video cables by the time the home theater boom began in the late 1980s and 1990s).

By the end of 1980, Bill was selling his LiveWire-branded cable to 42 specialty audio dealers in Southern California. With no formal business plan and just a few hundred dollars in the bank, Bill established AudioQuest and in 1981 expanded distribution throughout the United States and to every continent.

Thirty-plus years later AudioQuest is the premier provider of high-performance audio and video cables and accessories. AudioQuest's continuing success is driven by not being held prisoner to existing approaches and never resting on laurels. AudioQuest's ideals appeal to newbies with passionate curiosity and people willing to join us in our never-ending quest for lower distortion and better sound.

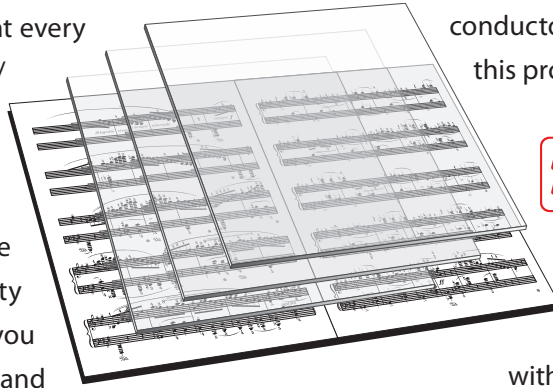

Do No Harm

Great sound and great pictures, music that consumes you, movies that transport you around the universe ... all come from honoring the original signal. The signal is at its greatest potential ... is least damaged ... at the source. It's an unavoidable fact that every component and cable in an audio/video system causes distortion, robbing the sound or the picture of some portion of its ability to inspire and to entertain. These aberrations add up like layers of dirty glass between you and an image you are trying to see. Better cables and components cannot improve the signals they carry ... performance can only be improved by causing less distortion of the original signal.

The goal of high-quality components is to be like cleaner panes of glass ... to minimize alteration or distortion of the signal. *Do No Harm!*

The Four Elements

The foundation on which AudioQuest's cables are built comprises the following four fundamental "elements" of design and manufacture. Another way to think of this is that these elements comprise the basic "recipe" for all cables. The choices the cable designer makes in selecting and balancing these materials and construction techniques determine the cable's ability to reduce distortion and noise and deliver high performance. An off-the-shelf cake mix, for example, might produce an edible product, but that's unlikely to match the efforts of an educated pastry chef who handpicks the finest, freshest local ingredients.

Solid Conductors

Strand interaction is the single greatest cause of distortion in cable. Semi-Solid Concentric Packed Conductors avoid many strand-interaction distortion mechanisms. Solid-core conductors are the complete solution to this problem.

Metal

Conductor metal quality is critical for the best cable performance. The conductor surface is the only area of the conductor with 100% current density at all frequencies. Smoothness of the conductor surface is paramount because the surface is a guide-rail for the entire energy envelope. The best copper and silver conductor metals have fewer grain boundaries and low oxygen content for low distortion and high performance.

Geometry

Geometry is the physical relationship of the conductors to one another within a cable. This determines the basic electrical characteristics of the cable. Different cable applications have different and specialized geometry requirements. Better geometry reduces distortion.

Dielectric (Insulation)

Insulation is necessary to keep the positive and negative conductors separate and to give stability to cable geometry. Insulation is also a "dielectric" because it is inside the conductor's magnetic field. Dielectrics absorb energy, which after a delay is then released in the signal, causing smearing and distortion. Better insulation reduces distortion by absorbing less energy.

NIGHTHAWK

- A Loudspeaker-Inspired Headphone Experience
- Patent-Pending Ergonomic Elements for Light, Comfortable Fit
- Acoustically Superior Materials, Including Sustainable "Liquid Wood"
- Biocellulose Pistonic Driver
- Patented Split-Gap Motor Dramatically Reduces Intermodulation Distortion
- 3D-Printed Biomimetic Sound-Diffusing Grille
- Headphone Cable Based on AudioQuest's High-Performance Loudspeaker Cables
- High-Performance, Direct-Silver Plated 3.5mm-to-1/4" Adaptor

EU Retail

599,00

AudioQuest's full-bore assault on both the state of the headphone art and on the limits to which quality, innovation, and sustainability can be achieved at an affordable cost. Every aspect was carefully optimized for high levels of sonic, ergonomic, and aesthetic performance.

Performance, Innovation, Value, Sustainability

NightHawk's earcups are made from a revolutionary material known as "Liquid Wood," which offers outstanding acoustic properties and is environmentally friendly. NightHawk's sophisticated loudspeaker-inspired earcup enclosures incorporate support beams that enhance structural integrity and minimize unwanted resonances and vibrations. An elastomer coating is carefully applied to the enclosures' internal surfaces to further reduce harmful vibrations, while a damping material comprising a purposeful blend of wool and polyester enables an extraordinarily smooth, natural frequency response.

NightHawk is the first completely original production headphone to use a 3D-printed part—a biomimetic grille that uses a complex diamond-cubic latticework to diffuse sound and defeat resonances.

NightHawk's 50mm piston drivers have a biocellulose diaphragm designed to take advantage of the material's outstanding rigidity and high-frequency control, while its patented split-gap motor has been devised to significantly reduce intermodulation distortion.

NightHawk's flexible headband efficiently distributes the headphones' weight, providing a sure and simple fit designed to minimize clamping force and enable long listening sessions. Finally, NightHawk's patent-pending

suspension system allows its earcups to move freely, accommodating heads of any shape or size, while decoupling the earcups, further counteracting harmful resonances.

Of course, NightHawk benefits from AudioQuest's 30+ years of experience in the high-performance cable business, including a headphone cable purposefully designed to minimize distortion and provide a deep emotional connection to the music. It uses many of the same ingredients found in our speaker cables and interconnects, including high-purity Solid Perfect-Surface Copper+ conductors, Foamed-Polyethylene insulation, Noise-Dissipation System (NDS), and silver-plated terminations. We also include

a custom 1/4"-to-3.5mm headphone adaptor that features thick Direct-Silver plating over the highest quality base metal, resulting in a part that isn't merely functional, but up to the standards of NightHawk itself.

With NightHawk, AudioQuest worked from the ground up, while never losing sight of the ultimate goal—to celebrate the singularly moving experience of listening to music through high-quality headphones.

USB Filter

Dual Line-Conditioning Circuitry

JitterBug

JITTERBUG

USB Filter

Dual Line-Conditioning Circuitry

- For use in series with any adaptive or asynchronous USB DAC, USB cable, and USB hard drive
- Removes parasitic resonance — a form of resonant distortion
- Presents a more dynamic and vivid musical experience

EU Retail

49.00

Use one JitterBug in series with any adaptive or asynchronous USB DAC and USB cable.

Use an additional JitterBug in parallel for improved playback performance.

Use JitterBug with other locally connected USB devices, such as hard drives, printers, and cameras, to effectively reduce audio interference.

Use JitterBug with USB-enabled network devices, such as routers, NAS devices, and streamers.

Use JitterBug with mobile devices.

How to Order Interconnect Cables

When ordering any factory terminated interconnect cable, please include these required elements:

Example	Qty.	Pair	Length	Model	Termination: Source End	Termination: Destination End
	1	Pair	3,0m	Big Sur	RCA	to RCA

Choice of Applications:

3,5mm male mini ↔ 3,5mm male mini	3,5mm female mini ↔ 3,5mm male mini ⁽¹⁾	3,5mm male mini ↔ 2 x RCA	5 pin DIN ↔ 5 pin DIN ⁽²⁾	2 x RCA ↔ 2 x RCA	iPod 30 pin ↔ 3,5mm male mini ⁽¹⁾	iPod 30 pin ↔ 2 x RCA ⁽¹⁾
						

⁽¹⁾3,5mm female and iPod 30-pin only available in certain models and certain lengths, please see the grid, ⁽²⁾other DIN and Naim® Audio configurations available.

Bridges & Falls

Bridges & Falls cables not only honor the fact that today's components require vastly more connectivity options than ever before, they take advantage of the efficiencies of making single-ended stereo cables in a single jacket to apply many of AudioQuest's most proven distortion-minimizing ingredients and design techniques. In Bridges & Falls you'll find better metals and other exotic materials

and technologies—including Air-Tube insulation (Dielectric), Dielectric-Bias System (DBS), and multi-layer Noise-Dissipation System (NDS)—at lower price points than ever before. While the design and materials employed in Bridges & Falls are formidable, there are very real reasons to choose cables from

the Rivers and Cosmic series. To accommodate the single (left/right in one) jackets, Bridges & Falls' solid conductors are smaller, and while Air-Tube insulation appears in this line, the tubes are by necessity smaller than you'll find in the Rivers and Cosmic series interconnects.

While DBS is present in a number of Bridges & Falls, DBS cannot extend all the way to the plugs. None

of this diminishes the astonishing cost-effective performance of Bridges & Falls, but it's important to know that even when the materials look identical there are still substantial reasons—reasons which are perfectly audible—for customers to choose Rivers and beyond when applications allow.

For REL subwoofer cables, see page 29. For FLX-Mini and FLX-X splitters, see page 43.

Noise-Dissipation System (NDS)

The challenge of shielding an audio or video signal from interference transmitted through the air, usually referred to as Radio-Frequency Interference or RFI, is an old game. It's also a game that is usually easily won. Despite promotional material that uses fear tactics to influence customers' purchasing decisions and despite those customers' understandable desire to find comfort and security with one brand or another, shielding just isn't that difficult. However, almost all shielded cables absorb and then drain noise/RF energy to "component ground," modulating and distorting the critical "reference" ground plane, which, in turn, causes a form of signal modulation—a distortion of the original signal. As a result, music and dialog often sound "hashy" and inarticulate, while spatial cues and ambience are vague and poorly defined.

Because the shield is much bigger than the signal conductors, it actually picks up more RFI than the conductors themselves—an unfortunate irony. However,

the cure doesn't necessarily have to be worse than the disease: By "shielding the shield," it is possible to achieve 100% shield coverage and to dump almost no energy on the reference ground plane.

AudioQuest's Noise-Dissipation System (NDS) uses alternating layers of metal- and carbon-loaded synthetics to "shield the shield," absorbing and reflecting most of this RF energy *before* it reaches the layer attached to ground. Increasing the number of metal- and carbon-loaded layers increases NDS' ability to reduce distortion. So, whether it's the Metal-Layer NDS of our new entry-level Chicago interconnect or the more advanced Carbon-Based 8-Layer NDS of our Fire interconnect, the result is clean, clear, dimensionally nuanced sound that comes from a silent black background. Music and dialog are easier to understand and appreciate, which means the overall listening experience will be far less fatiguing and far more rewarding, compelling, and *fun*.

The Fifth Element: Directionality

An honorary Element—the *Fifth* Element—Directionality is a surprisingly beneficial attribute of all drawn-metal conductors.

In order to fabricate copper or silver into a strand or conductor, it must first be cast and then drawn through a die—a process that inevitably creates a directional, chevron-like pattern in the conductor's internal grain structure. While some have worked to eradicate conductor directionality and others have decided to ignore it altogether, we have learned to use conductor directionality to our advantage.

The conductor's asymmetrical grain structure creates a superior, low-impedance path for the highest frequencies. High-frequency interference emitted from radio stations and cell towers will *always* take the path of least resistance, traveling close to the conductor's surface and following the direction of the grain. Choosing to ignore directionality leaves open the possibility of orienting a cable such that its primary signal will be forced to travel *against* the grain, and, therefore, against the flow of high-frequency noise. This, in turn, leaves the cable susceptible to unpleasant

and highly audible dynamic intermodulation distortion, caused by the interaction between radio-frequency interference and the audio signal.

However, when a cable is oriented so that the primary signal travels in the direction of the grain, *with* high-frequency noise, dynamic intermodulation and the associated ringing generated by the interaction of the audio signal with radio-station and cell-tower noise will be greatly reduced. High-frequency noise will still be there, of course, but it will be far more innocuous.

Therefore, by properly controlling for directionality, AudioQuest minimizes the deleterious effect of high-frequency interference on sensitive audio circuits.

That unpleasant, strained 2D sound one hears when conductors have the wrong orientation is the audio-frequency penalty for noise entering and modulating an active circuit. The more relaxed 3D sound of correctly oriented conductors is the happy result of less high-frequency interference—conductor directionality fully acknowledged and put to its best use!

Digital-Audio Cables from HDMI to Computer Audio

Many of the design and material elements that have proven so effective in AudioQuest's analog cables are every bit as meaningful for digital- and computer-audio cables, including S/PDIF, HDMI, USB, USB iPod 30-pin, FireWire, and Ethernet. Solid-core conductors, superior conductor metals and insulation materials, proper geometry and overall precision of manufacture are no more or less important at the frontier of digital-audio cables than they are for analog cables.

AudioQuest's digital cables start with Long-Grain Copper (LGC) conductors, which is a low-distortion metal with fewer grain boundaries and low oxygen content. Each successive step up in the line adds the cost-effective performance benefits of silver plating (in increasing amounts), with the top cable in each digital cable family employing AudioQuest's best conductor metal, solid 100% Perfect-Surface Silver (PSS). Geometry is optimized for each application, with insulation materials ranging from hard-cell foam to solid polyethylene. Because all audio cables are directional, all signal conductors are controlled for directionality and connectors are labeled to ensure optimal sound quality.

All dielectric (insulation) slows down and smears the signal traveling inside the conductor, and when insulation is unbiased it slows down different frequencies at different energy levels by varying degrees. This is a real problem for time-sensitive, multi-octave audio, and a significant distortion mechanism for all audio cables, digital or analog.

Digital audio was really never just ones and zeros. Indeed, the analog interconnects that connect your outboard DAC to your stereo are as important as the AC power cables that connect the computer audio components to your home's AC power. When using a USB, Ethernet or FireWire DAC, the cables that connect the computer and DAC have as profound an impact on the sound you hear as the sonic characteristics of the DAC itself. What's perhaps more surprising is that the peripheral cables that connect the computer to external storage and connect components over networks also make a significant difference in sound quality. Every cable in a network-audio system adds distortion to the signal. Therefore, the entire computer-audio experience will be more fun and more involving if low-distortion cables are employed throughout the entire computer- and network-audio system.

Cat6 & Cat7 Ethernet/Communication Cables

Wireless networks (Wi-Fi) provide a convenient solution for connecting to the Internet or sending and receiving emails and files. However, when it comes to streaming high-resolution media throughout the home, the convenience of Wi-Fi comes with significant performance compromises. At a distance of only 20 feet, some wireless routers lose as much as 85% of their data throughput. These losses in throughput cause dropouts in your media, higher-variable compression rates, and an overall loss in audio and video fidelity. In addition, as you increase the number of devices on a wireless network, you *decrease* the potential bandwidth available to each device.

Wired Ethernet offers uncompromised data rates at distances up to 328 feet for Cat7 and 180 feet for Cat6, avoiding Wi-Fi's precipitous dropoff in data rates over distance. This ensures that all of your high-quality media streams reach their intended end devices (TVs, Apple TV, Roku, receivers, audio streamers) with no compromise to the data. The end result is greater reliability and better sound and picture.

Even generic Ethernet cable offers audio performance that's clearly superior to the fastest, most robust wireless networked-audio system. Moving beyond the limitations of wireless, the specific cable matters, too. AudioQuest offers multiple CAT600 (Cat6) and CAT700 (Cat7) bulk Ethernet cables for whole-house "electronic plumbing," as well as prepared RJ/E Ethernet cables. While Cat6/CAT600 cables support network speeds up to 1 Gigabit per second (Gbps), Cat7/CAT700 cables support network speeds up to 10 Gbps at 100 meters length. AudioQuest's CAT700 and RJ/E prepared Ethernet cables are all built on a Cat7 foundation, the highest Cat standard.

Our CAT600 DCP (Digital Copper Plumbing) combines Solid Long-Grain Copper (LGC) Conductors, controlled for proper digital-audio directionality, with Solid High-Density Polyethylene insulation that both ensures critical signal-pair geometry and minimizes insulation-induced phase distortion. CAT600 FMJ (Full Metal Jacket) offers all the same benefits as DCP, but adds an overall shield for lower noise, cleaner sound, and greater dynamics. CAT700 Pearl

uses Hard-Cell Foam insulation because the stiffness of the material allows the conductors in the cable to maintain the same geometric relationship along the full length of the cable, thus ensuring that the characteristic impedance of the cable is consistent. CAT700 Forest and CAT700 Carbon offer all of the same benefits as CAT700 Pearl, but upgrade from Pearl's Solid Long-Grain Copper conductors with Solid 0,5% Silver and Solid 5% Silver conductors, respectively.

For shorter runs in high-performance applications, AudioQuest's RJ/E Ethernet line offers a complete solution with an easy, affordable entry and a clearly worthwhile, exciting upgrade path. RJ/E Pearl combines Solid Long-Grain Copper conductors with our geometry-stabilizing Solid High-Density Polyethylene insulation in a simple, but handsome PVC jacket. The durable gold-plated connectors provide 100% shield coverage and feature an extra-strong tab for flawless performance. RJ/E Forest upgrades Pearl's copper conductors with our Solid 0,5% Silver conductors, while the still-affordable RJ/E Cinnamon adds an attractive black-and-red braid and takes another step up to higher-purity Solid 1,25% Silver conductors. Vodka's Solid 10% Silver conductors offer improved clarity and detail, while its Carbon-Based 3-Layer Noise-Dissipation System (NDS) shields the shields, absorbing and reflecting most of the sonically detrimental noise/RF energy before it reaches the layer attached to ground. Finally, our top-of-the-line RJ/E Diamond makes the big jump up to our highest quality metal—Solid 100% Perfect-Surface Silver (PSS) conductors—and adds our patented Dielectric-Bias System (DBS) for unrivaled performance, with clearer overall sound, extraordinary detail, and stunning dynamic contrasts.

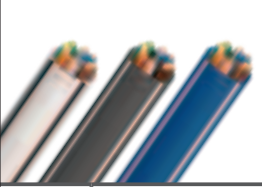

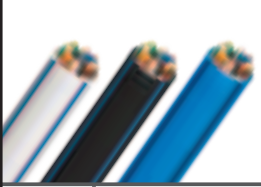

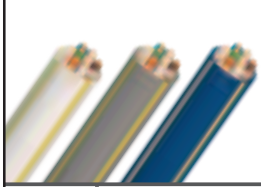

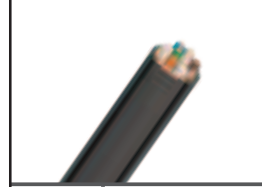

In addition to AudioQuest's hallmark materials and techniques, the top Ethernet models feature extreme-performance Telegärtner RJ45 connectors, which employ a patented combination of geometry and circuitry to minimize impedance-mismatch distortion. The improvement in performance is slap-in-the-ears obvious and indicative of the difference all connectors and materials make.

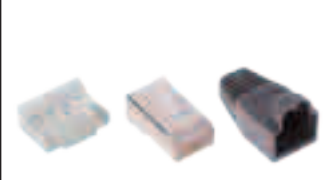

Once you hear our RJ/E Ethernet cables, you'll never go back to the "convenience" of wireless.

How to Order Prepared Speaker Cables

To order: first please specify type of connector (banana or spade), then the finish of connector (gold or silver).

Pair prices shown. Also available in singles (i.e., for center channel, subwoofer or mono) at half pair price.

When ordering any factory terminated speaker cable, please include these required elements:

Qty.	Pair or Single	Length	Model	FR, SBW, DBW or SBA	AMPLIFIER Termination	SPEAKER Termination	Gold or Silver
1	Pair	10 ft.	Rocket 88	FR	500 Series Multi-Spade to Banana		Gold
1	Single	6 ft.	Castle Rock	SBA	1000 Series Multi-Spade to Banana		Silver

When ordering 3 (or 5 or 7) individual cables, please order: 1 pair + 1 single (or 2 or 3 pairs + 1 single, as appropriate)

Speaker Cable Terminations

Full-Range (FR)

(Non-BiWire)
All models

Single-BiWire (SBW)

Speaker Cables

True Compatibility and Optimization: Context is Everything

Why does AudioQuest offer more than one series of cables? Shouldn't one cable or the other always be better or worse?

Yes and no. Context is everything. Driving inefficient speakers on the other side of the room is very different from driving a pair of desktop speakers close to the amp. As a baseline, it's important to understand that all speaker cables cause sonic degradation that accumulates with length. Though several other distortion mechanisms are also cumulative, inductance, and its smearing of time integrity, is the primary culprit causing an increasing loss of focus.

A low-level audio interconnect doesn't carry power and doesn't have to manage strong magnetic fields, so we almost always recommend putting the amp as close as possible to the speakers and, if required, running a long interconnect. With a very few easy-to-predict exceptions (a few tube preamps, passive preamps, and low-input impedance amps), interconnect performance is far less susceptible to sonic degradation that accumulates with length.

Identifying the best possible cable for any given application is not all about resistance (or impedance). It's about power. A normal 18 AWG lamp cord is rated to safely carry 10 amps—enough to kill you. Getting power to a speaker is easy. Getting it there *undistorted* is complicated. AudioQuest makes some very large speaker cables because diluting the energy and resulting magnetic fields

across more metal is an effective brute-force way to reduce a number of distortion-causing mechanisms. The lower impedance of such large cables does allow some amplifiers to better "control" the motion of the bass driver. However, this effect is usually much smaller than the overall full-bandwidth improvement that results from causing less distortion *within* the cable.

The very effective Counter-Spiral Geometry of AudioQuest's Tree Series is made possible by a bigger cable with more conductors. However, in the more moderately sized AudioQuest Flat Rock Series, the money that didn't go into the more expensive geometry and *more* metal is used for higher-quality metal, making it possible for our Comet and Meteor Flat Rock models (fantastic in my desk system!) to take full advantage of the openness made possible by AQ's Perfect-Surface Silver (PSS) conductors.

So, while it's still possible to tailor a cable to fit your specific needs, it is also possible to reasonably and rationally choose a cable that will bring you closer to your music. It's up to you. The result of your decision should always be sound that is cleaner, clearer, and more naturally beautiful, for a listening experience that is compelling, enriching, and fun.

AC Power

Just as low-distortion speaker cables enable greater performance from an A/V system, low-distortion AC power cables enable greater performance from all A/V components. Interestingly, AC power cables have similar positive effects when used on both the input and output of power-line conditioners. And because AC power and speaker cables are subject to many of the same distortion mechanisms, they benefit from many of the same damage-minimizing design elements and techniques.

While AudioQuest's entry-level power cords use cost-effective semi-solid concentric packed conductors to minimize magnetic interaction between strands, most of our power cords use solid conductors to *completely* eliminate this distortion. Superior metals minimize distortion in *all* applications, so AQ's power cords use the same low-distortion, high-performance metals found in AQ's signal-carrying audio cables. Typical AC power cables use a shield system that absorbs and then drains noise and RF energy to component ground, consequently modulating and distorting the critical "reference" ground plane. AudioQuest's Noise-Dissipation

System (NDS), however, used in our NRG-4 power cable and up, comprises alternating layers of metal- and carbon-loaded synthetics to "shield the shield," absorbing and reflecting most of this energy before it reaches the layer attached to component ground.

And don't overlook the crucial wall plugs on AC power cables. While many of AQ's wall plugs are Gold-Plated, AQ's top-tier AC power cables use our Hanging-Silver process, in which the pure-copper plugs are submerged ("hung") into a vat of extreme-purity silver. The result is a very thick, Direct-Silver Plate with no performance-degrading intermediary materials, such as nickel. NRG-500 Wall Plugs use Hanging-Gold directly over pure Purple Copper, while NRG-1000 Wall Plugs use Hanging-Silver directly over pure Red Copper.

Like our signal-carrying cables, AudioQuest's AC power cables benefit from a careful balance of superior materials and time-tested construction techniques to minimize distortion and enable high performance from your A/V system.

Accessories

SorboGel Q-Feet System

Set of 4 energy-absorbing feet each with a "tray" which improves performance and protects furniture. Each foot supports up to 4 kg. (8 lbs.).

EU Retail 109,00/Set of 4

RCA Noise-Stopper Caps

Blocks a significant path for incoming high-frequency energy to interfere with circuit performance.

EU Retail 42,50/Set of 10

XLR Input or Output Noise-Stopper Caps

Blocks a significant path for incoming high-frequency energy to interfere with circuit performance.

EU Retail 31,50/Set of 2 per Box

Sorbothane Self-Stick Sheet

6" x 6" x 0,10" sheet can be cut to size to damp anything, especially effective on top surface of speaker stands.

EU Retail 27,50

Binding-Post Wrench

Real tool-quality double-ended nut driver with metal inserts.

Fits 7/16" & 1/2" binding posts.

EU Retail 14,50

PSC BiWire Jumpers

Solid PSC Copper Jumpers replace stamped jumpers supplied with BiWireable speakers. Four 4" jumpers.

- Choose:
- BiWire Jumpers-G (Direct-Gold Plated)
 - or
 - BiWire Jumpers-S (Direct-Silver Plated)

EU Retail 27,50/Set of 4

PreAmp Jumpers

Solid PSC+ conductors in Polyethylene Air-Tubes. Replaces factory fitted "U" jumpers on integrated amps & receivers.

EU Retail 31,50/Pair

Voltage Upgrade Kit for DBS

FOR USE WITH EXISTING DBS CABLES ONLY.

Kit includes:
2 x 72V DBS packs (inc. batteries)
4 x Velcro bands

EU Retail 165,00/Kit

Splitters and RCA Adaptors: Mini Plugs

For subwoofers requiring the use of both RCA input jacks, order FLX-X RCA splitter (FEMALE RCA → 2 MALE RCAs) in addition to the subwoofer cable.

Installer ("i") Series Cables in Packs of 5 (No EU Retail Packaging)

iPacks

Time, space, and money ... all finite resources for any installer, all of which are conserved with AQ's iPacks. These 5-packs of cables ship with no retail packaging, take up less space on the truck and reduce waste to dispose of on the job. iPacks save a bit of money too, and each bag includes easy-to-remove stickers that offer an immediate visual inventory of how many cables are left in the bag, and assist in billing for each and every cable installed in a job. iPacks are an installer's best friend.

Making Connections

At AudioQuest, we refuse to limit ourselves to conventional methods of design and manufacturing. As audiophiles and music lovers, we know that “good enough” is never really good enough and that there is *always* room for improvement. If it means that we can deliver a higher-quality product, we will always be far happier to innovate, spending our days and nights tinkering and tweaking, developing new parts, machines, and tools, and discovering new solutions to challenging problems. The only time we pick a part out of a catalog is when we can’t find a way to do it better ourselves. (The extraordinary Telegärtner RJ45 connector used on our RJ/E Vodka and RJ/E Diamond cables is one fine example.) Whenever possible, we specify our materials and design our own connectors at AudioQuest, so that our cables reach their full potential and you get the long-lasting quality and exceptional performance you deserve.

Connectors

To provide the best possible performance for each application, AudioQuest designs each of its connectors from the ground up. These components are absolutely crucial to the overall performance of a cable, and

AudioQuest is not beholden to “off-the-shelf” OEM parts. Painstaking care is taken to evaluate the highest quality materials and design for every application. In addition, rather than using the customary phosphor-bronze or copper alloys (which are much harder metals and therefore easier to machine), AudioQuest pushes the art by using two grades of *pure* copper—Pure Purple Copper and even higher-purity Pure Red Copper—as the base material in many of our RCA, XLR, and 3,5mm Mini connectors. These pure coppers are softer and therefore more difficult to machine, but the sonic results are more than worth the added effort.

Direct-Plating Process

AudioQuest pays special attention to the plating it uses over its connectors’ carefully crafted base metals. Whenever possible, gold connectors are plated directly over the copper, with no sonically destructive intermediate layer of nickel or alloy. All silver-plated connectors are Direct-Silver plated.

For years, the standard for “quality” in the cable industry has been very shiny gold plugs on both speaker cable and interconnect plugs. The advantages of gold, however, are primarily cosmetic: In no way

Making Connections

does it improve the performance of the product. The jewel-like shine to plugs is most often achieved by using intermediary layers of nickel, which only diminishes the quality of the termination. At AudioQuest, performance is not compromised for an “eye-candy” appearance.

AudioQuest’s latest designs feature plugs that are directly plated using a process known as Hanging Silver. Rather than using conventional drum-tumbler plating, this labor-intensive process requires that each plug is attached to a hanger and “hung” in a pure-silver bath. Not only does this provide a very thick Direct-Silver plate with a gorgeous finish, but the exact chemistry of the plating bath and the bonding of plating to the underlying part can now be more productively controlled—something you can hear, and, over time, see. Though cleaning with a silver-cleaning cloth may eventually be necessary, Hanging-Silver is comparatively immune to tarnishing. Hanging-Gold plating, using the same process described, is also available upon request. The result is *natural* beauty and outstanding performance.

Cold-Weld System

Joining conductors to plugs requires every bit as much care and precision as any other aspect of cable manufacture. AudioQuest’s Cold-Weld System uses several tons of pressure to make a near-perfect connection that ensures that the structural integrity of the conductor and plug is kept completely intact, all without the damaging effect of heat. Cold-Welding avoids the introduction of heat and extra materials like solder, which change the character of the wire at the point of termination. (By the way, all solder is *not* created equal.) Solder is by far the most common method of connection. Resistance welding is clearly superior to even

the best solder. However, welding, like solder, introduces an inferior layer of dissimilar material, causing distortion and reflections. The alloy created at the interface of conductor and plug, though far superior to solder, is still an undesirable intermediary layer of material. To obtain the best, lowest-distortion cable performance, attention must be paid to the contact system, as well as the quality of conductors and plugs.

AudioQuest has incorporated Cold-Weld connection technology into most of our interconnects and all prepared speaker cables, from modestly priced cables like Evergreen interconnect to the bleeding-edge WEL (William E. Low) Signature models.

The Perfect Connection

Just as there is no such thing as a perfect cable or a perfect audio system, there is no such thing as a perfect cable connector. At AudioQuest, we are nevertheless dedicated to eliminating as many problems as possible, so that we can reach the best-possible compromise—the solution whose benefits far outweigh any disadvantages—knowing that we will never stop working to close the gap between reality and perfection.
